- ❖ *Summary & Conclusions*

# Background

- ❖ Air quality problems, such as the urban smog, aerosols, dusts, and acid rain, can affect human health, ecological environment, agriculture, businesses and climate.
- ❖ Air quality is related to many aspects of the earth environment and living beings on the Earth.
- ❖ One particular aspect that has been much emphasized in the research community for the past three decades due to the increased evidence is **climate change**.

**Air Quality**

Global warming

Radiation budget

Regional climate change

Hydrological cycle

# Tropospheric ozone

- ❖ Tropospheric ozone is a major photochemical pollutant.
- ❖ It is harmful to human health, agriculture and buildings.
- ❖ High ozone concentrations in the lower troposphere is one of the most important issues of air quality.
- ❖ Tropospheric ozone also plays an important role in climate change as a greenhouse gas.
- ❖ Global-scale modeling studies estimated the global annual mean radiative forcing due to tropospheric ozone to be  $0.2 \sim 0.55 \text{ W/m}^2$  (eg. *De Froster et al.*, 1996; *Portmann et al.*, 1997; *Haywood et al.*, 1998).

# Outline

- ❖ *Background*
- ❖ *Research Objectives and Approach*
- ❖ *Model Descriptions - Purdue Regional Climate and Chemistry Model (PRCCM)*
- ❖ *Case Study*
- ❖ *Model Results*
- ❖ *Summary & Conclusions*

# Research Objectives

- ❖ **To perform air quality modeling with climate model**
  - ❖ Simulate tropospheric ozone distribution and transport accurately at the regional scale
- ❖ **To investigate the impacts of tropospheric chemistry on climate modeling**
  - ❖ Should chemistry be included in regional climate modeling?
- ❖ **To investigate the regional climatic impacts of tropospheric ozone**
  - ❖ Direct radiative forcing and warming effects
  - ❖ Indirect effects on moisture distribution
  - ❖ Influence on atmospheric stratification and the regional atmospheric dynamics

# Approach

- ❖ Development of a *on-line* coupled climate-chemistry model at the regional scale that is capable of regional weather/climate forecasts and of describing the evolution of tropospheric ozone.
- ❖ Considerations of the interactions between tropospheric ozone and regional weather/climate.
- ❖ Model validation and evaluation with a case study.
- ❖ Regional climatic impact analyses with numerical simulation results.

# *Off-line and On-line Modeling*

## Off-line

- ❖ Using archived meteorological data from historical weather data or another model as the input to the photochemical model.
- ❖ Only a fraction of meteorology information is available and interpretation is necessary.
- ❖ Potential inconsistency and incompatibility.
- ❖ No interaction between meteorology and chemistry.
- ❖ Efficient in computation.
- ❖ Easier to operate.

## On-line

- ❖ Using dynamic fields generated from the imbedded meteorological model as the input to the photochemical model.
- ❖ All meteorological information is available at each time step.
- ❖ Chemistry feedback can be considered in meteorological modeling.
- ❖ Requires extensive computation resources.
- ❖ Integration must be comprehensive

*Recommended in recent reviews and research.*  
[eg. *Byun and Ching, 1999; Seaman, 2000*]

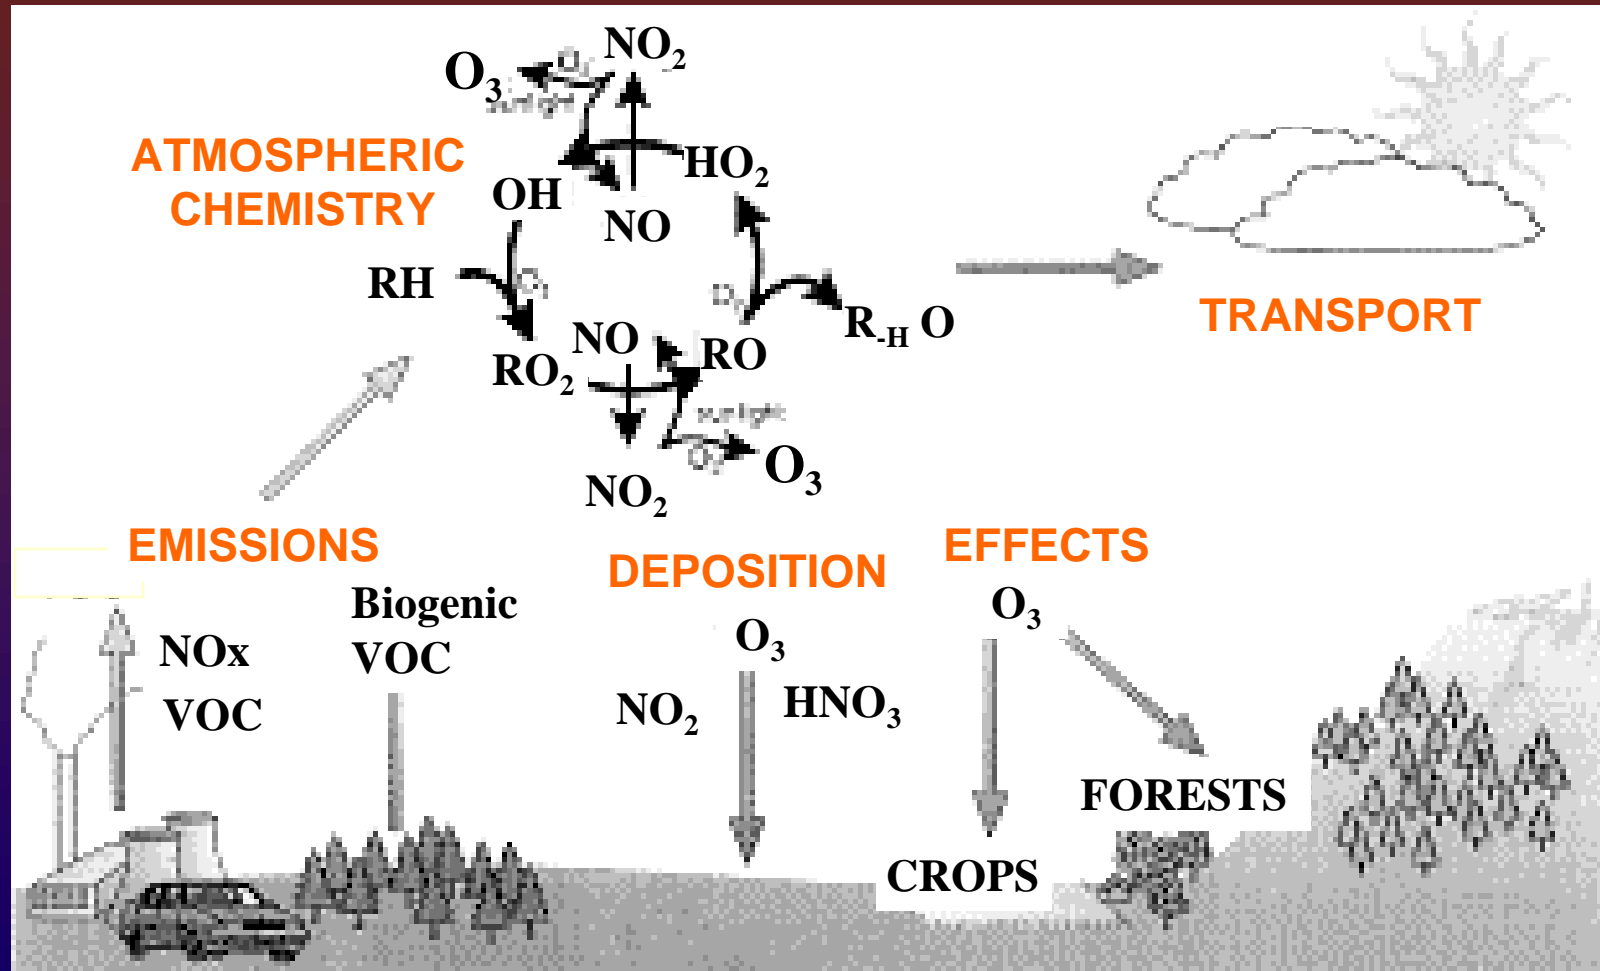

# Approach

- ❖ Development of a *on-line* coupled climate-chemistry model at the regional scale that is capable of regional weather/climate forecasts and of describing the evolution of tropospheric ozone.
- ❖ Considerations of the interactions between tropospheric ozone and regional weather/climate.
- ❖ Model validation and evaluation with a case study.
- ❖ Regional climatic impact analyses with numerical simulation results.

## Atmospheric Model

### Meteorology Dynamics

Atmospheric dynamic  
& thermodynamics fields

### Radiation Model

Radiation fluxes, Radiative heating rate  
 $= f(\text{clouds, aerosols, } O_3, CO_2, H_2O, T, P)$   
Photolysis rate calculations

### Transport Module

Advection, diffusion

### Photochemical Chemistry

Chemical Transformation

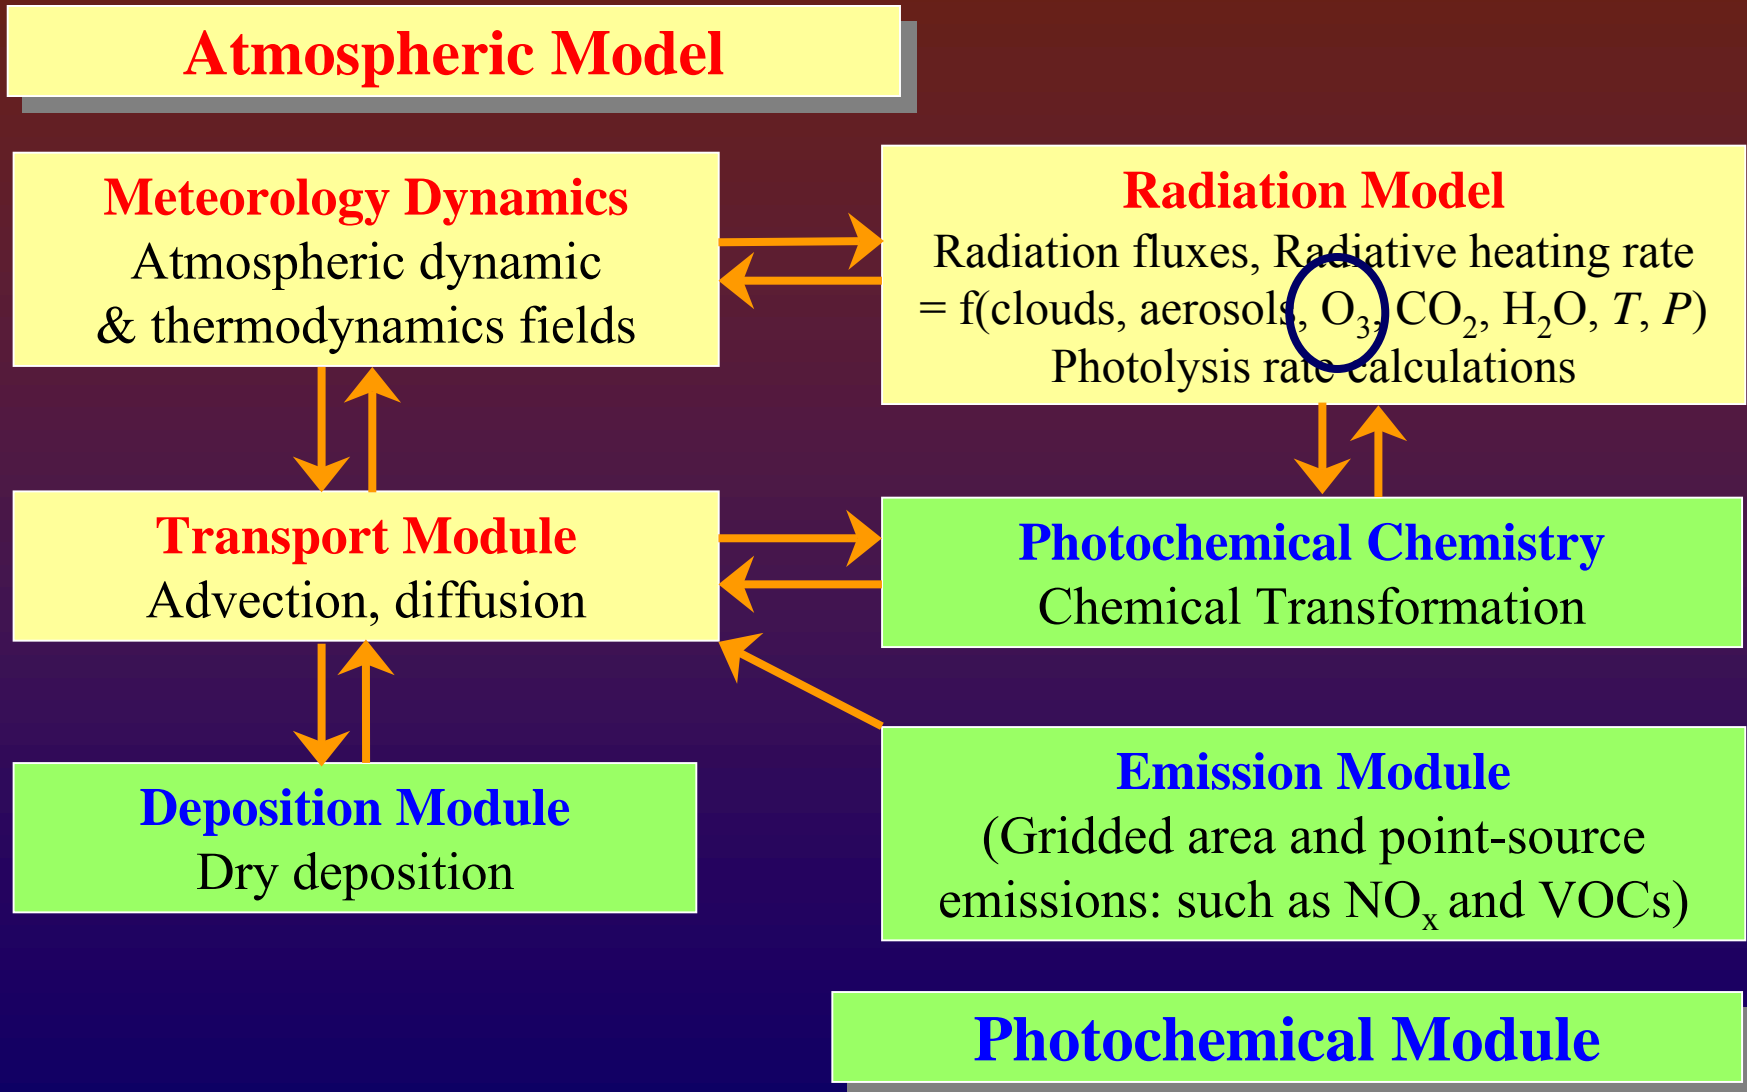

### Deposition Module

Dry deposition

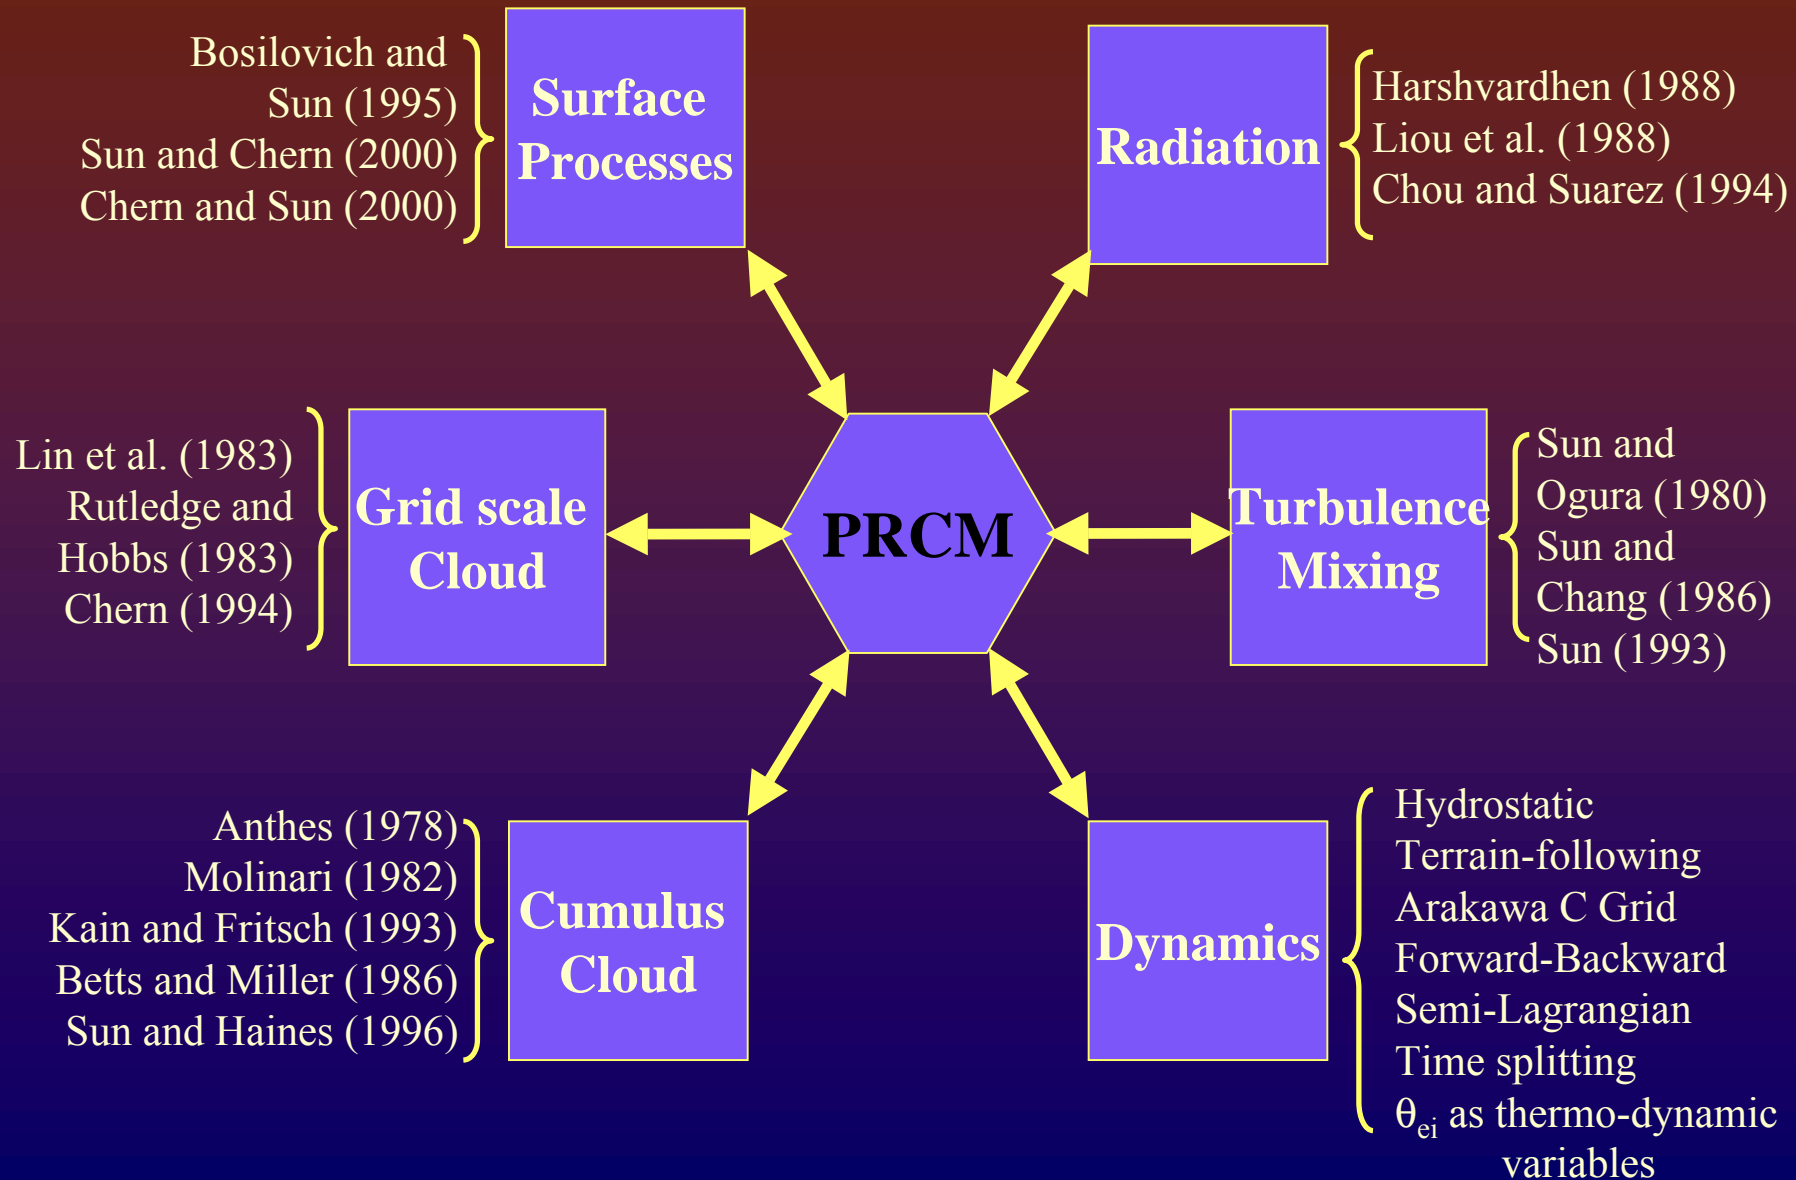

### Emission Module

(Gridded area and point-source  
emissions: such as  $NO_x$  and VOCs)

### Photochemical Module

# Purdue Regional Climate Model (PRCM, *Purdue Mesoscale Modeling Lab*)

# Photochemical Module

**Gas-phase Chemistry mechanism** - SAPRC97 (*Carter, 1995, 1997*)

- 184 reactions and 76 species
- 39 species are treated as “state species” , 33 are treated as radicals, and 4 are treated as constants (water vapor, CH<sub>4</sub>, O<sub>2</sub> and air).

**Gas-phase Chemistry solvers:** Modified IEH (Implicit-Explicit Hybrid)

**On-line photolysis calculation:**

- Modified radiation model in the PRCM calculates photolysis rates with an empirical parameterization scheme

## *Coupling: climate-chemistry interactions*

$$\frac{\partial c_i}{\partial t} = \underbrace{\left(\frac{\partial c_i}{\partial t}\right)_{adv} + \left(\frac{\partial c_i}{\partial t}\right)_{diff} + \left(\frac{\partial c_i}{\partial t}\right)_{dry\ dep} + \left(\frac{\partial c_i}{\partial t}\right)_{emission}}_{\text{Tracer transport with atmospheric modeling}} + \underbrace{\left(\frac{\partial c_i}{\partial t}\right)_{chemistry}}_{\text{photochemistry}}$$

Tracer transport  
with atmospheric modeling

photochemistry

In the lower 15 model layers, photochemistry, chemical tracer transport and the radiative feedback of tropospheric ozone are performed *on-line* with the atmospheric modeling processes.

The radiation code drives the photochemistry by providing photolysis rates and takes account for the radiative effects of tropospheric ozone in atmospheric modeling.

# Outline

- ❖ *Background*
- ❖ *Research Objectives and Approach*
- ❖ *Model Descriptions - Purdue Regional Climate and Chemistry Model (PRCCM)*
- ❖ *Case Study*
- ❖ *Model Results*
- ❖ *Summary & Conclusions*

# Model Validation: Case Study

## **The July 1998 Ozarks Isoprene Experiment (OZIE)**

- ❖ Modeling time period: July 16~22, 1998
- ❖ Model domain (Based on the Eastern-Unified Grids)
- ❖ Emission Data: EPA NET99 and biogenic emissions (provided by the Lake Michigan Air Director Consortium)
- ❖ Surface-level and aircraft measurements of tropospheric ozone are available for comparison.

# *Model Domains*

Domain #1:

79x68 grid points  
with 36km resolution

Domain #2:

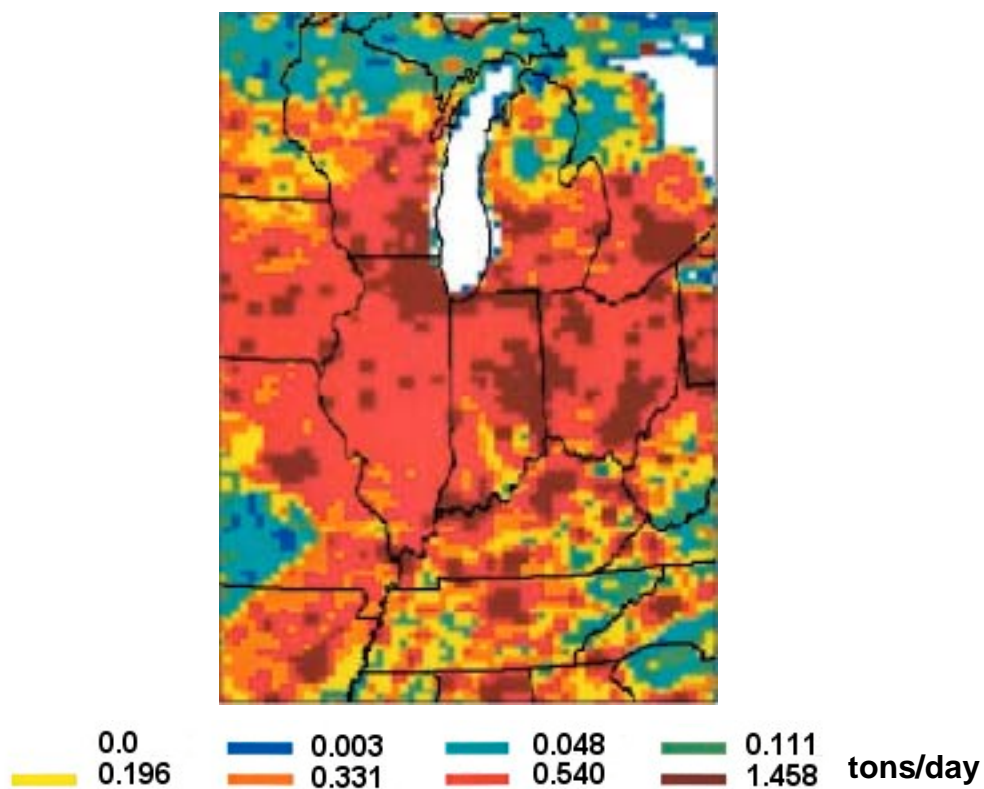

102x111 grid points  
with 12km resolution

28 vertical levels

soil 4 layers

# *Emissions*

Low-level NO<sub>x</sub> Emissions (Tons/day)

BEIS2 Modeled Hourly Isoprene Concentrations(ppb)

# Model Setup

- ❖ **Case 1**: Chemistry-free **PRCM** control run for domain#1
- Case 2**: Chemistry-free **PRCM** control run for domain#2
- Case 3**: Interactive climate-chemistry **PRCCM**(Yang, 2004) run for domain#2
- ❖ Time steps: 100 seconds and 30 seconds in atmospheric modeling for domain #1 and #2, respectively.
- ❖ Photochemistry is calculated every 10 minutes with photolysis rates updated every 30 minutes with the radiation calculation
- ❖ Emissions are added every 1.5 minutes.
- ❖ **85%** computational time is spent in photochemical modeling.

# Aircraft Measurements vs. PRCCM Modeled Ozone

# Measurements vs. PRCCM Modeled Ozone

Surface-level Measurement [Ozone] ppb<sub>v</sub>

at four EPA monitoring stations  
during July 18~22, 1998

Aircraft Measurement [Ozone] ppb<sub>v</sub>

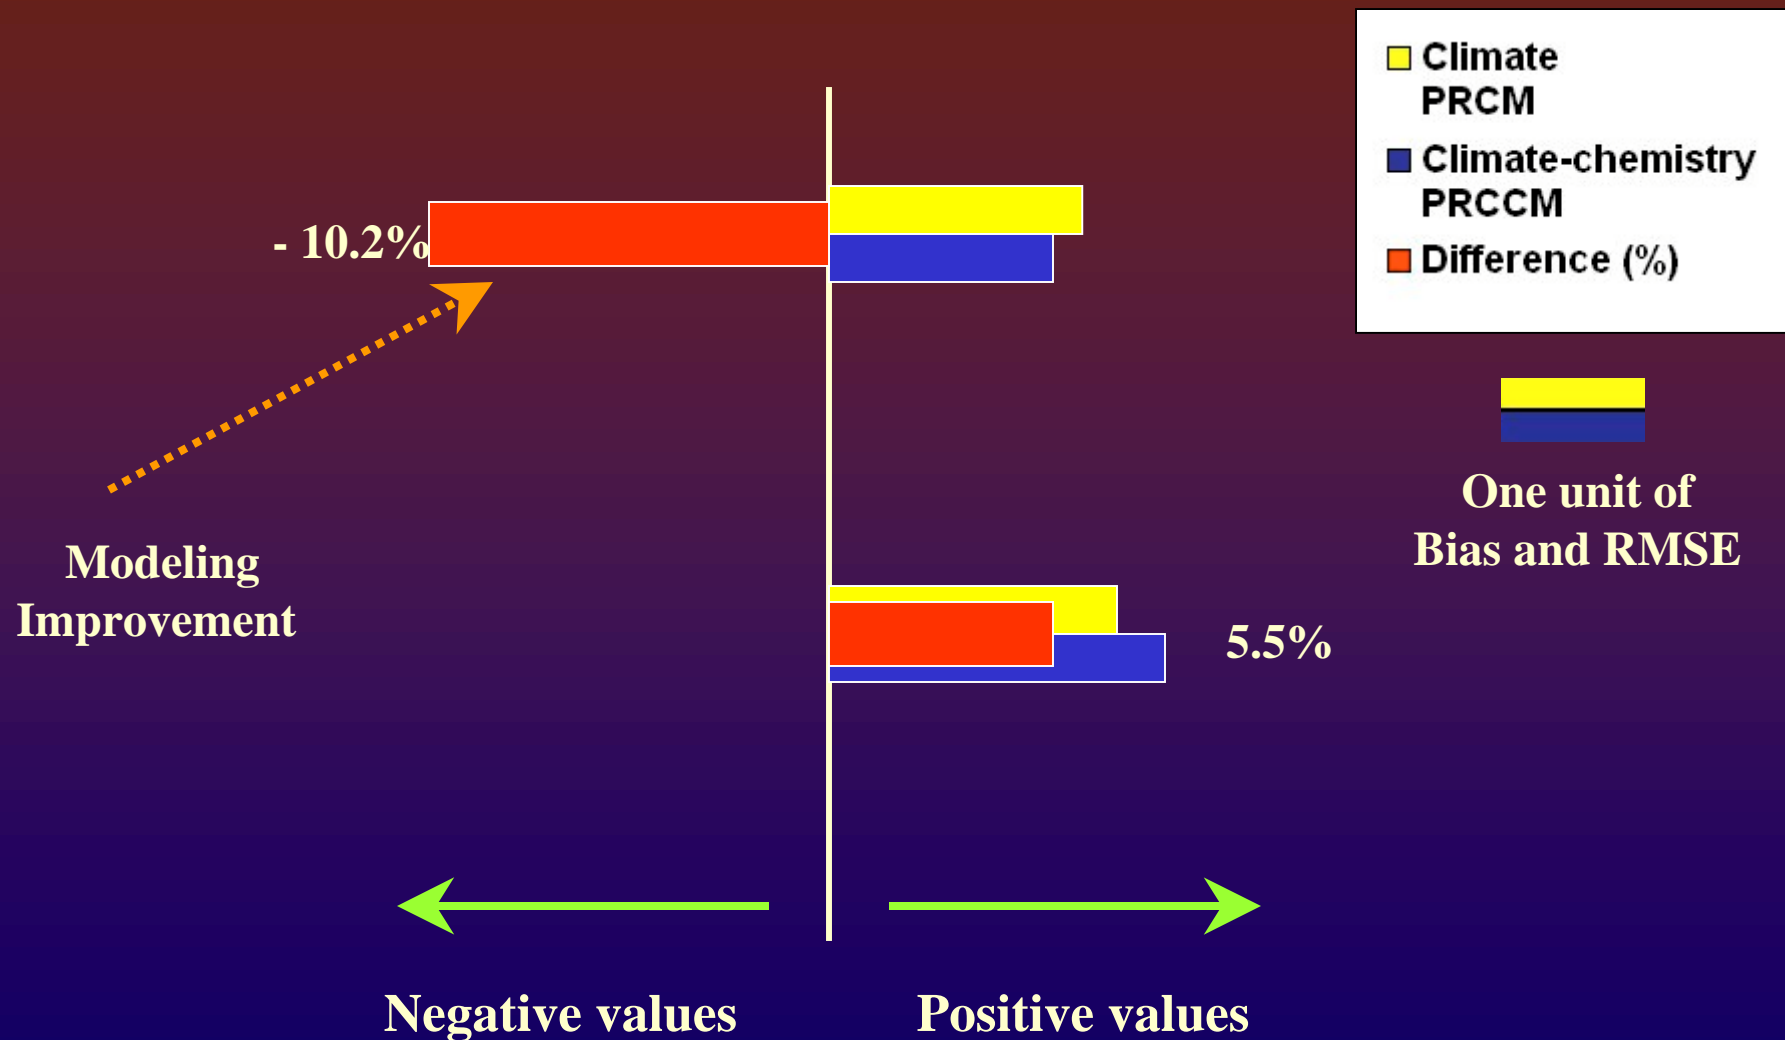

from four aircraft ozone measurement  
missions on July 18~21, 1998

# **Coupled Climate-chemistry modeling**

**Improvements in climate/atmospheric modeling with tropospheric chemistry?**

**Regional climatic Impacts due to increased tropospheric ozone from the photochemical pollution?**

# Model bias and RMSE against ECMWF

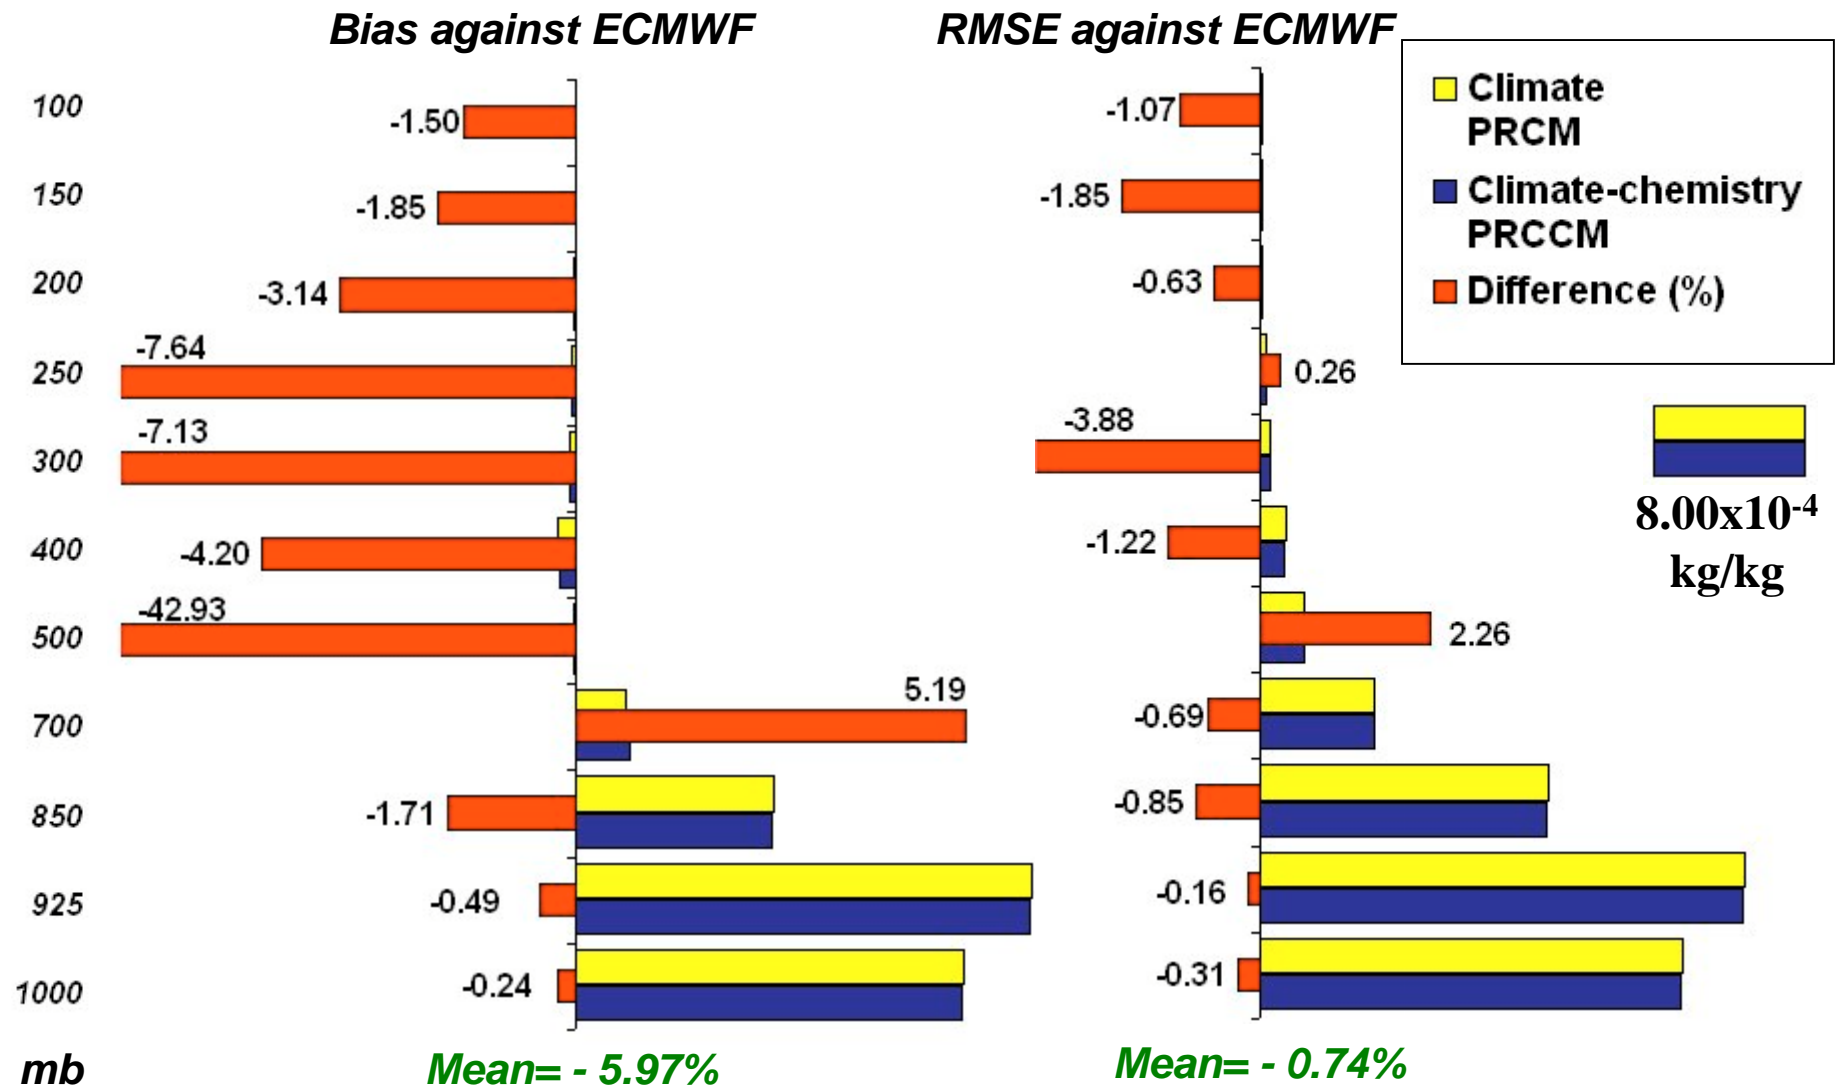

# Air Temperature Predictions

# Atmospheric Moisture Qv Predictions

# Atmospheric RH Predictions

# Climatic Impact Analysis Methodology

- ❖ Analyses are carried out with the modeled meteorological fields from the interactive climate-chemistry *PRCCM* run and from the chemistry-free *PRCM* control run.
- ❖ The only modification in atmospheric modeling processes from two computer runs is real-time updated tropospheric ozone in the radiation calculation of the *PRCCM*.
- ❖ Therefore, the differences between two model run results can be regarded as the impacts due to the increased tropospheric ozone.

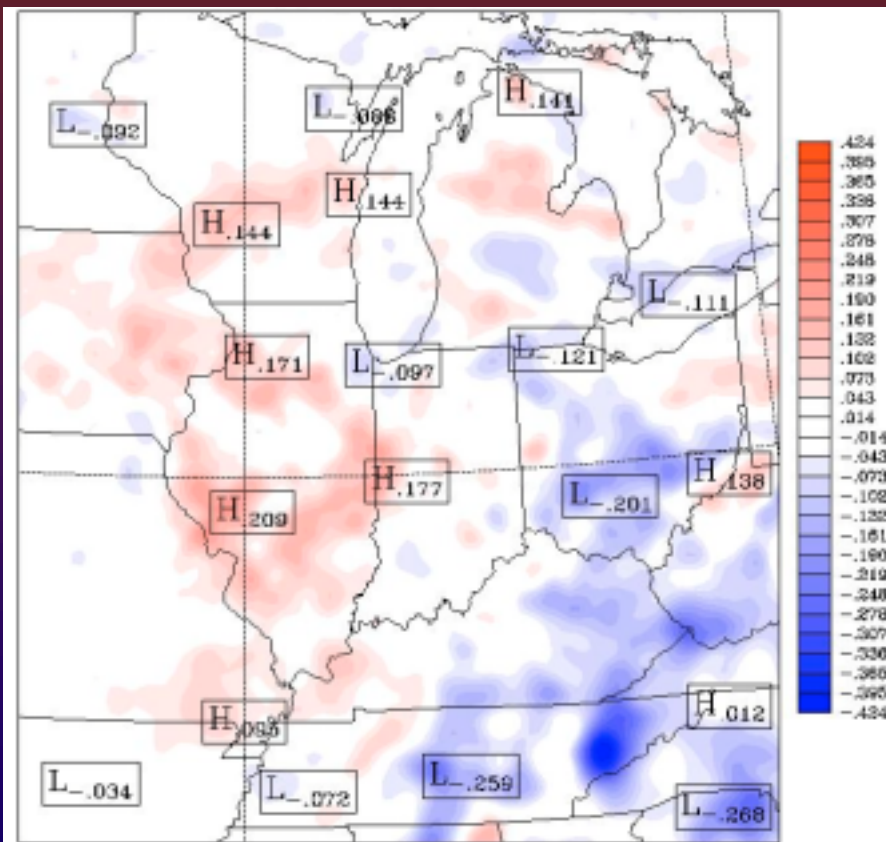

**Climatic Impacts = PRCCM results - PRCM results**

# Mean Daily Peak Surface-level Ozone

# Surface Flux Change

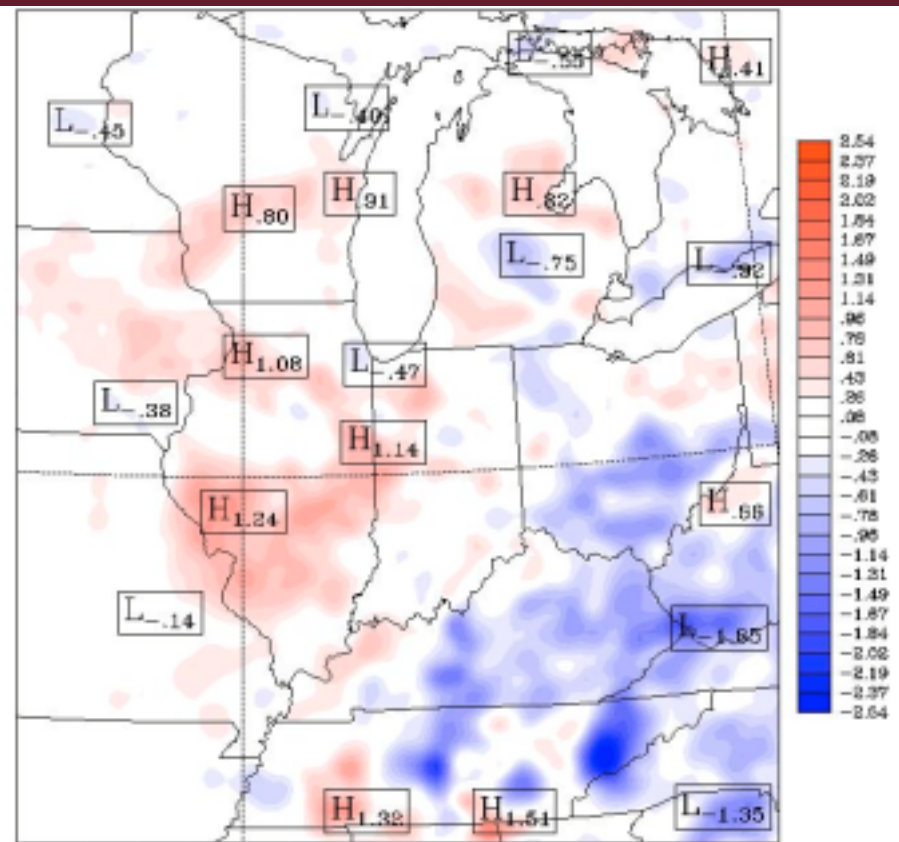

(PRCCM run- PRCM control run)  
Mean Surface Air temperature (k)

Min. = -.424 Max. = .209 Interval=.029

**Domain average=  $-3.85 \times 10^{-3}$  k**

# Outline

- ❖ *Background*
- ❖ *Research Objectives and Approach*
- ❖ *Model Descriptions: Purdue Regional Climate and Chemistry Model (PRCCM)*
- ❖ *Case Study*
- ❖ *Model Results*
- ❖ *Summary & Conclusions*

# Summary and Conclusions

- ❖ A regional coupled climate-chemistry model **PRCCM** has been developed.
  - ❖ On-line tropospheric ozone modeling is carried out with quality-assured meteorology directly from the atmospheric model including the radiation to drive photochemistry.
  - ❖ The feedback of ozone in lower troposphere is considered in climate modeling processes through its radiative properties.
  - ❖ A truly interactive climate-chemistry model.
- ❖ **Model validation and evaluation**
  - ❖ The atmospheric model successfully reproduced the meteorological fields.
  - ❖ Tropospheric ozone predictions are reasonable accurate compared with surface-level and airborne measurements.

# Summary and Conclusions

- ❖ **Improvements of climate modeling with chemistry**
  - ❖ That implies the necessity to include atmospheric chemistry in weather/climate modeling processes.
- ❖ **Strong climatic impacts due to tropospheric ozone**
  - ❖ PRCCM results show the uneven climatic impacts at the regional scale due to a photochemical episode. Strong warming effects were observed near pollutant areas.
  - ❖ Regional moisture redistribution and modification of atmospheric stratification may further influence regional dynamics.
- ❖ **This coupled mode can be the future generation of air quality model as well as climate model that accounts for dynamical, physical and chemical processes in the atmosphere**

# Acknowledgements

- Support from NSF

# Future Considerations

- ❖ Aerosols and their interactions with other atmospheric constituents in atmospheric processes should be included in future development.
- ❖ Many uncertainties remain in the modeling processes. To name a few, emissions and photolysis as well as chemistry mechanism to represent atmospheric chemistry.
- ❖ Computational efficient chemical model to present atmospheric chemistry is needed.
- ❖ Future regional/global climate change studies can benefit from this kind of coupled climate-chemistry model.
